AMENDMENTS TO THE ABSTRACT

Kindly replace the original abstract with the following substitute abstract:

ABSTRACT

Provided is a game system in which a plurality of game execution apparatuses, having internal structures different from each other, are capable of proceeding with a game while sharing characteristics of a character appearing in the game. A stationary game apparatus 100 obtains character data from a server apparatus 600, and writes the character data to a memory card 300. The stationary game apparatus 100 executes a stationary game software program stored in a DVD 500 using the character data stored in the memory card 300. A portable game apparatus 200 executes a portable game software program stored in a cartridge 400 using the character data stored in the memory card 300.
